LIGHTING EQUIPMENT FOR—

Gasoline's Star Salesman Is Good Illumination

Good illumination is just as vital to small stations as to large ones.

Actual case studies made in various sections of the country conclusively prove that modern lighting can substantially increase business. Conservative figures indicate that modern lighting will at least double the night business of the average service station. This is due to the fact that 87% of all impressions come through the eyes. The station that is properly floodlighted becomes a landmark in the darkness. It signals the approaching motorist — tells him

that a service station lies ahead — gives him a chance to turn in before he has passed by.

Modern illumination bespeaks modern service. It has drawing power for street and highway traffic. It advertises the service station and increases daytime business through returning customers whose attention was attracted at night. All comprehensive studies of the retail gasoline business repeatedly show the important part which modern lighting plays toward increasing sales.

GASOLINE SERVICE STATIONS

A Complete Line that Fills Every Need for Efficient Illumination

The Goodrich Electric Company has specialized in the illumination of gasoline service stations. In this complete line you will find modern lighting fixtures to meet every requirement for outside or inside use. The popular Standlite was originated by Goodrich to give you a modern, dignified fixture which would

require less space, bring light nearer the ground for servicing and provide greater efficiency with less glare. All Goodrich equipment has been designed after thorough studies of service station problems, to answer these special requirements in the most efficient and economical manner.

Explanation of Equipment Shown Below

In this typical, modern service station, yard illumination is supplied by Floodlights and Standlites. On the outside corners of the property are No. 90 Floodlights mounted on poles and adjusted to cover the ground area toward the station. In the middle foreground is a No. 81 Floodlight mounted on a pole and directed on the station itself. The pump islands are illuminated with two Standlites each, mounted on 10' poles. On the property line and on corner poles are Mercury Vapor Standlites which supply an

unusual color, that immediately attracts the attention of traffic. Bulletin sign is illuminated with Keystone Sign Reflectors while the small round emblem sign on the corner is illuminated with Round Emblem Sign Reflectors. A directional sign light indicates the Women's Wash Room. Within the station Glassteel Diffusers and Outlet Box Reflectors supply overhead illumination. On the lifts are mounted 4 Liftlites which move up and down with the lift to furnish glareless illumination for greasing operations.

No. 77

DIRECT STANDLITE

THE OIL INDUSTRY'S CHOICE
FOR SERVICE STATION ILLUMINATION

PERMANENTLY FINISHED IN VITREOUS FIRED PORCELAIN ENAMEL

With the highly competitive conditions which obtain today it is imperative that the modern service station should be illuminated in a manner to attract the fast moving stream of motorists. Goodrich Standlites bring the light closer to the ground thus giving greater efficiency and less glare. Attendants can service cars more quickly and the station is agleam with light. Results — more motorists attracted — quicker service — more gallonage — greater profits.

The Goodrich Standlite is an entirely weather-proof porcelain enameled fixture combining unusually high efficiency with good appearance. Delivers high

intensity illumination especially suitable for gasoline service stations, parking lots and other similar areas.

The Standlite is designed for the illumination of areas where a uniform high intensity of light is required. The large porcelain enameled reflector diffuses the light over a wide area from the pole outward in all directions utilizing the full efficiency of the lamp for useful illumination.

All the functions normally performed at a filling station during the day can as easily and quickly be done at night under Standlite illumination. Due to its low mounting height, the Standlite can be easily cleaned and relamped.

No. 77 DIRECT STANDLITE

National Electrical Code Standard

FOR PUMP ISLANDS AND OTHER SERVICE STATION AREAS

The Goodrich Standlite was designed especially for service station illumination and produces a wide spread of diffused light from its low mounting height of 10 to 12 feet. The diffusing qualities of its permanent porcelain enamel finish evenly distributes the light to secure uniform high intensity. The charts shown below indicate the excellent results which may be obtained from one No. 77 Standlite when used alone for any location around the service station. While readings are shown to a radius of only 20 feet, the distribution of Goodrich Standlites extends considerably beyond this distance.

The charts below show the intensities which may be obtained from two No. 77 Standlites when used for pump island illumination.

CONSTRUCTION AND FINISH

The Goodrich Standlite is ruggedly constructed and entirely weatherproof. Holder is made of cast aluminum and slips 2 inch pipe. The reflector is permanently finished in vitreous fired green porcelain enamel. Other colors will be supplied when ordered. Prices do not include lamps.

Combination Standlite

National Electrical Code Standard

PERMANENTLY FINISHED IN VITREOUS FIRED PORCELAIN ENAMEL

The Combination Standlite combines the Direct Standlite with a close mounting floodlight for effective lighting of pump islands and buildings at gasoline service stations. Floodlight is adjustable for vertical and lateral positioning. Equipped with water-tight clear glass lens. All wiring is concealed.

The Standlite when mounted from 10 to 12 feet high produces uniform high intensity over the surrounding ground area. This low mounting simplifies installation and servicing. The permanent porcelain enamel finish is easily cleaned to retain its original high efficiency.

The Goodrich Standlite is ruggedly constructed and entirely weatherproof. Cast aluminum holder slips 2 inch pipe.

Standard finish of reflector is vitreous fired green porcelain enamel. Other colors will be supplied when ordered. Prices do not include lamps.

Pump Globe Adapter

For Standlites

A weatherproof concealed wiring adapter for mounting Standlite and Globe on gasoline pumps.

No. 7736

There are many gasoline service stations in locations where the traffic is not sufficiently heavy to warrant the expense of wiring for Floodlights and Standlites. In most of these stations, however, the pumps are wired and are illuminated by globes of varying styles.

In order to provide an inexpensive means of using a Standlite in such locations, the Pump Globe Adapter was created. This fitting permits the mounting of the Standlite on a gasoline pump which is equipped with a globe having a 6 inch fitter. The adapter merely fits into the present globe fitter which is on the pump and provides for concealed wiring to the Standlite. It also provides a fitter for the globe.

This adapter, therefore, provides a means of using the present globe as well as extending the line to a Standlite for the illumination of the area about the

pump. The adapter is 41 inches long which provides for mounting of Standlite with the edge of the reflector 46 inches above the top of the pump. The adapter permits the use of any style of globe up to 21 inches in diameter.

Standard finish is green, but other colors will be supplied when ordered. The upper section of the adapter is fitted with a 2 inch pipe to take the ordinary Standlite. When supplied with switch either the globe or the Standlite or both may be burned at the same time. Prices do not include Standlites.

FLOODLIGHTS

WITH POLE MOUNTING HOOD

CONCEALED WIRING STYLE

All Goodrich Pole Mounting Floodlights are supplied in permanent vitreous fired porcelain enameled finish which is easily cleaned to retain its original high efficiency. Equipped with cast aluminum ventilated hood which allows the Floodlight to be completely removed from the hood without disturbing the wiring. This construction offers many advantages. During installation and wiring, only the hood is handled instead of the heavier complete unit, the Floodlight being easily attached to the hood after the wiring has been completed.

Cleaning is simplified since the Floodlight may be removed, taken to the ground, and cleaned, then

attached to the hood. This hood construction, there-

fore, eliminates the hazardous part of the job of installing or cleaning Goodrich Floodlights. The pole mounting hood allows complete vertical and lateral positioning. Two large set screws securely lock the hood in the correct position.

Cast aluminum pole mounting hood is concealed wiring style and slips 2 inch iron pole.

It is exceptionally easy to wire since the covers of both the bracket and hood are removable permitting line wires to be brought through the large wireway and connected directly to the easily accessible socket terminals. The wiring, therefore, is easily and quickly completed even without splicing and without removing the socket.

Floodlights can be supplied with inner beam projectors which serve to concentrate a portion of the light to build up intensities on distant areas or objects. Inner Beam Projectors are made from Durak electro-chemically processed aluminum and are supplied only when ordered.

FLOODLIGHTS WITH BRACKET MOUNTING HOOD

Clamps around 1" to 2" pipe

Showing hole spacing on bracket arm

Attaches to wooden crossarm and other flat surfaces

OPEN WIRING STYLE

All Goodrich Bracket Mounting Floodlights are supplied in permanent vitreous fired porcelain enameled finish which is easily cleaned to retain its original high efficiency. Equipped with cast aluminum ventilated hood which allows the Floodlight to be completely removed from the hood without disturbing the wiring. This construction offers many advantages. During the installation and wiring, only the hood is

handled instead of the heavier complete unit, the Floodlight being easily attached to the hood after the wiring has been completed.

Cleaning is simplified since the Floodlight may be removed, taken to the ground, and cleaned, then attached to the hood. This hood construction, therefore, eliminates the hazardous part of the job of installing or cleaning Goodrich Floodlights. The bracket mounting hood allows complete vertical and lateral positioning.

Cast aluminum bracket mounting hood is open

wiring style and can be mounted either on pipe or wooden surface as shown in the illustrations above. Either the U clamp or lag screws may be used, and any desired adjustment can be secured as the arm permits universal adjustment.

It is exceptionally easy to wire, since the cover of the hood is removable, permitting line wires to be brought through the large wireway and connected directly to the easily accessible socket terminals. The wiring, therefore, is easily and quickly completed even without splicing and without removing the socket.

Floodlights can be supplied with inner beam projectors which serve to concentrate a portion of the light to build up intensities on distant areas or objects. Inner Beam Projectors are made from Durak electro-chemically processed aluminum and are supplied only when ordered.

Diffuso Floodlight

No. 90

PERMANENTLY FINISHED IN VITREOUS FIRED PORCELAIN ENAMEL

The Goodrich Diffuso Floodlight is designed for evenly illuminating large areas, such as gasoline service stations, athletic fields, golf practice courses, bathing beaches, tennis courts, parking spaces, freight yards, industrial property and other similar places. Equipped with cast aluminum ventilated hood for pole or bracket mounting which allows

floodlight to be quickly removed for cleaning without disturbing the wiring. Both styles of hoods are weatherproof and provide for complete vertical and lateral positioning. Standard finish is vitreous fired green porcelain enamel. Other colors will be supplied when ordered. Prices do not include lamps.

Pole Mounting

Cast aluminum pole mounting hood is for concealed wiring. Slips 2 inch iron pipe. Allows for vertical and lateral positioning. Removable caps and large wire-way permit connecting line wires directly to socket terminals without splicing and without removing socket.

Portable Outdoor Floodlight

PERMANENTLY FINISHED IN VITREOUS FIRED PORCELAIN ENAMEL

Goodrich Portable Outdoor Floodlights are especially designed for the outdoor illumination of buildings, driveways, entrances, temporary signs, outdoor greasing pits, lift areas, etc. Reflectors are high fired vitreous porcelain enamel and are supplied both with and without watertight glass lens. Being entirely weatherproof and portable, these floodlights offer an inexpensive method of illumination. Some styles have holes in the base for mounting on wall or they may be spiked to the ground. Others have clamp for fastening to iron pipe where a more or less permanent installation is required.

Goodrich Portable Outdoor Floodlights are made of heavy gauge rustless iron, and finished with three coats of vitreous fired green porcelain enamel. They have 90° of vertical adjustment and 360° of horizontal adjustment around the base. Base style floodlights are equipped with 8 feet of all rubber duplex cord with attachment plug. Shipped in individual carton containers. Sockets are all approved by Underwriters' Laboratories. Prices do not include lamps.

Flexolite

PERMANENTLY FINISHED IN VITREOUS FIRED PORCELAIN ENAMEL

No. 1374
With Bracket Arm

The Goodrich Flexolite is an economical porcelain enameled weatherproof floodlight offering a wide range of utility for indoor or outdoor illumination. The low price of this unit, together with its permanent finish and complete adjustability, recommends the Flexolite for such locations as work shops, garages, gardens, recreational areas or for protection against prowlers at night. The reflector is made of rust-resisting iron and permanently finished with three coats of vitreous fired porcelain enamel, gray outside.

BRACKET ARM—Floodlight is equipped with bracket arm and mounting plate providing universal adjustment and an easy method of mounting on horizontal or vertical surfaces. Supplied with eight feet of duplex rubber covered cord with plug and Underwriters' approved medium base socket.

PIPE BRACKET—Floodlight is equipped with adjustable cast fitting tapped for $\frac{1}{2}$ inch conduit and Underwriters' approved medium base socket. When specified, $\frac{3}{4}$ inch tapping will be furnished at same price. Designed for concealed wiring.

OUTLET-BOX BRACKET—Floodlight is equipped with adjustable bracket arm and a bushed cord-entrance cover for mounting on $3\frac{1}{4}$ inch or 4 inch standard outlet-box. Supplied with two feet of duplex rubber covered cord and Underwriters' approved medium base socket.

The Flexolite is packed one complete floodlight in a corrugated shipping container. Prices do not include lamps.

Durak Aluminum Weatherproof Area Light

The Goodrich weatherproof Area Light is designed for the outdoor illumination of signs, buildings, grounds, driveways, and other outdoor areas. Equipped with Durak electro-chemically processed aluminum reflector. Standard finish is bronze. Supplied with or without watertight glass lens.

Area Light is available in three styles to suit practically all installation requirements and provides a means of securing effective and economical illumination.

BRACKET ARM — Area Light is equipped with adjustable bracket arm for clamping on 1 to 2 inch pipe, or it may be attached to wooden crossarm or other flat surface. Supplied with Underwriters' approved mogul base socket.

PIPE BRACKET — Area Light is equipped with adjustable cast fitting tapped for $\frac{1}{2}$ inch conduit and Underwriters' approved mogul base socket. When specified, $\frac{3}{4}$ inch tapping will be furnished at same price. Designed for concealed wiring.

CAST BASE — Area Light is equipped with cast base and swivel providing complete vertical and lateral positioning. Can be spiked to ground or fastened to flat surface. Supplied with eight feet of duplex rubber covered cord and Underwriters' approved mogul base socket.

Packed one complete Area Light in a corrugated shipping container. Prices do not include lamps.

No. 949

Showing Installation of Goodrich Liftlites

Suggested Method of Installation

Dimensions Given Below

A Special Fixture for Lift Tracks—Illuminates Underside of Chassis—Shields Operator from Glare—Adjusts to Throw Light in Any Direction Desired

The view shown above illustrates how Liftlites are raised and lowered with the lift to provide efficient, glareless illumination for the underside of the chassis.

The only fixture of its kind — designed specifically for auto lifts. Mounted to move up and down with the track. Liftlites are small, compact, out of the way. They eliminate direct glare in the eyes of the operator. Reflector may be turned upward, sideways or downward as the need for light requires. The use of low wattage lamps combines efficiency with economy.

Showing Diskonect Construction

The diagram shown above illustrates a suggested method of installation.

Goodrich Liftlites are supplied with the Goodrich Diskonect Hood which makes it possible to remove reflector and lamp as a unit by simply

lifting the spring-set plunger in the hood. It is not necessary to disturb the wiring. The socket may be removed by giving it a quarter turn, leaving the reflector entirely free of electrical parts and permitting it to be completely submerged for cleaning. Hood is heavily cadmium plated, rust-proof.

The reflector is permanently finished in vitreous fired green porcelain enamel. Other colors will be supplied when ordered. Liftlites are available singly or in sets of four, as listed below. Prices do not include lamps.

No.	Lamp Size	Tap-ping	Description	Shipping Wt.	Std. Pkg.	List Price

MERCURY VAPOR LAMP FLOODLIGHTS and STANDLITES

For Greater Illumination— Greater Attraction Value

The brilliant illumination of the Mercury Vapor Lamp has a striking effect on the observer owing to the lack of red rays in this light. The newness and practical advantages bring a rapidly growing demand for Mercury Vapor Lamps and fixtures.

A Variety of Styles for Service Stations, Buildings, Yards, etc.

Goodrich offers both Floodlights and Standlites for use with high intensity Mercury Vapor Lamps. For illuminating gasoline service stations, building entrances, yards—wherever greater brilliance or startling color effect is desirable, Mercury Vapor Lamps are a practical low-cost solution.

Although the lamp itself is higher in price, yet with longer life, the lower current con-

Showing combination mounting of Mercury Vapor Lamp Diffuso Floodlight with pole top transformer and Incandescent Lamp Diffuso Floodlight.

sumption of the Mercury Vapor Lamp offers many advantages especially when combined with other fixtures using Incandescent lamps.

Where true color discrimination is desired combinations are available for using both Mercury Vapor and Incandescent lamps. With this combination, color values approximating true daylight are obtained. Particular care, however, must be used to see that the 400-watt Mercury Vapor Lamp is always burned in a vertical position. If allowed to deviate more than 10 degrees, the arc stream will touch the side of the glass tube and ruin the lamp. The 400 - Watt Mercury Vapor Standlite listed on page 12, requires base-down burning lamp.

Showing shielded Mercury Vapor Lamp Standlite mounted on bracket for effective lighting of the corner or edge of gasoline service stations.

Mercury Floodlights

Equipped with ventilated cast aluminum hood for pole or bracket mounting. Standard finish is permanent vitreous fired green porcelain enamel. Other colors will be supplied. Inner Beam Projectors are made of Durak electro-chemically processed aluminum and are supplied only when ordered. Prices do not include transformers or lamps.

BIPOST LAMP FLOODLIGHTS

PERMANENTLY FINISHED IN VITREOUS FIRED PORCELAIN ENAMEL

Bipost base lamps, developed to fill the need for high wattage light sources of small size and rugged construction, are supplied in 500 watt, 750 watt and 1000 watt sizes, and are designed for base up or base down burning.

The bulbs are made of heat resisting hard glass having very low thermal expansion which makes them resistant to breakage resulting from sudden temperature changes. This very greatly reduces bulb failure resulting from contacting rain, snow, or sleet, and makes the lamp very desirable for outdoor service.

The bipost lamp has a cubical content of about one third that of the equivalent wattage in a standard screw base lamp. The use of the bipost base permits more accurate focusing of the filament. Al-

though the burning position is specified as base up or base down, the bipost lamp will operate satisfactorily if tipped not more than 20° from the vertical.

The base consists of two posts which are a continuation of the leads which support the filament. The posts are sealed to a flat heat resisting glass section, and this saucer is then sealed to the bulb.

Bipost lamps require a porcelain socket of special design to accommodate the bipost prongs, hence it is not possible to underlamp a fixture using bipost lamps as easily as those using standard lamps because bipost lamps are not made in sizes under 500 watt, and are not carried in stock by all lamp dealers.

The advantages claimed for the bipost lamp are small size, more even maintenance of efficiency, extreme ruggedness, less likelihood of a fixture being underlamped by the user, more resistant to temperature changes, therefore less apt to be damaged when unprotected in outdoor service against rain, snow, or other unfavorable weather conditions.

Bipost Lamp Floodlights

Equipped with ventilated cast aluminum hood for pole or bracket mounting. Standard finish is permanent vitreous fired green porcelain enamel. Other colors will be supplied. Inner Beam Projectors are made of Durak electro-chemically processed aluminum and are supplied only when ordered.

Goodrich Engineers Provide A Complete Lighting Service

You will find in the following pages the clearest, most complete and concise information ever compiled to help you select, plan, and install proper lighting equipment. Lighting curves and charts, as well as a series of lighting plans and layouts, provide complete data for spacing and mounting Floodlights, Standlites, and other lighting equipment.

This data has been prepared and is presented with the sole idea of making it simple and easy to use. You can now eliminate guesswork and

accurately determine the correct amount of illumination necessary as well as the proper equipment and its correct application for each job.

Regular use of the charts and layouts in this section will save you time and trouble in planning your installations. On practically any question requiring the selection of lighting equipment or recommended methods of installation, you have the answer here at your fingertips.

Free Assistance on Any Other Lighting Problems

We maintain a separate engineering department, staffed by experienced illuminating engineers who will gladly answer any problem, recommend layouts and methods whenever this advice is desired. Do not hesitate to write us. This department is maintained to help you and is free for the asking.
